

Groupster is a mobile application that connects groups of friends to other groups of friends.

We will be pulling an API from facebook, so its facebook integrated. Users must enter a verification code to make sure they are not bots.

Once logged into the app, you have to create a crew. You can select up to three members from your facebook friends list, only of the same sex you are, so male or female groups only. Once invited, you choose your activity i.e. bar, club, restaurant ,other. This should all be on one page that you are doing this from which is the "create a crew page". Multiple activities can be selected, and if selected other they must specify. Once everything is completed, you click create a crew and you are asked to give that crew a specific name.

Navigation works through the swiping bar like tinder, we want to keep that.

The home page is the browsing page, where you like/dislike groups. You like the group as a whole, so members individually say yes or now and if there is a mutual match then they match and can chat. The browsing page should display the whole crew, so members, their names, crew name, their selected activities, total hangouts, and whether they are groupster certified or not. If they are not groupster certified than that star is empty or something like that. This ensures that they have hungout and have been rated a fun group without deterring people away from having a bad rating. This page should also display the X and check mark.

The current crew page shows all your crews, and if you have a pending crew it will show, and you swipe left or right to reject it. Each crew on this page should have the users photo first with their name under it, and all other members of that crew with the crew name and total matches/unread messages. This allows for easier UX on the actual individual crew so its not congested and have to see who is in it. We also want a private chat integrated on this page(current crew page).

Individual crew. Should have private chat and all other chats. Top right is crew settings where it will display all members of the crew and crew settings.

News feed should be something like venmo, only displaying what a crew did or where they went or whether a crew went up in a cumulative rating or is groupster certified.

Chat is simple, we want picture messaging integrated. Top right is chat settings where they can mute the chat and schedule a hangout.

We would need a hangout page, and a ratings page.

I have basically gone through the whole app, if you have any questions let me know prior to beginning to design it so we don't have to run into additional problems.
